

Preston Luie

After reading and watching the videos I learned a lot of different things in regards to what the differences are between a front end as well as a backend developer. One of the most interesting things that I found was from the [roadmap.sh](#) link which has some information about how long it could take to become a Frontend Developer. I found it very interesting that the reading says that it might only be a matter of months in order to get a job as a front end developer. Before reading that part of the article I had no idea that getting a job as a Frontend developer could happen so quickly. Understandably though, you must also be very effective as a Frontend developer and be able to learn quickly as well as practice a lot. I also learned similar information about becoming a back end developer which states that it may be possible to gain a job given that you have understanding of the processes taking anywhere from months to years. Additionally, I learned that if you are only just getting started in Backend programming, useful languages would be Python and Java which is good for me as I am already somewhat familiar with both. Furthermore, when it comes to Frontend development it is useful to know HTML and CSS which I am becoming more familiar with as time goes on. Overall, through the videos as well as articles I learned a lot about the differences between Frontend and Backend development and it allowed me to have a better picture of what I may want to do as a job in the future.
